# Basic principles of capillary GC

## Capillary columns for GC

### The GC system

### The separation process

Chromatographic separation is achieved through continuous distribution of each sample component between the mobile and the stationary phase:

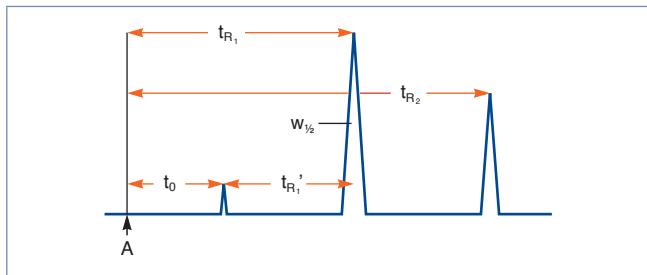

In GC, the **mobile phase** is always a gas, either He, N<sub>2</sub>, Ar, or H<sub>2</sub>.

The **stationary phase** is often a viscous, gum-like liquid adhered to the inner wall of a capillary column (WCOT = Wall Coated Open Tubular).

Transport of the components occurs exclusively in the mobile phase, while separation only takes place in the stationary phase. The quality of a separation (resolution) depends on the residence time of the components within the stationary phase and on the rate of interactions. The type of interaction between component and phase (selectivity) is determined by the functional groups of the stationary phase. The polarity of the phase is a function of its substituents.

### The chromatogram

A chromatogram consists of a base line and a number of peaks. The area of a peak allows quantitative determinations:

A component can be identified by its retention time (qualitative determination):

$$t_{R_i} = t_0 + t_{R_i'}$$

t<sub>0</sub>: dead time = residence time of a solute in the mobile phase (time required by a component to migrate through the chromatographic system without any interaction with the stationary phase)

t<sub>Ri</sub>: retention time = time interval between peak i and the point of injection

t<sub>Ri'</sub>: net retention time = difference between total retention time and dead time t<sub>0</sub>. It indicates how long a substance stays in the stationary phase.

Other terms characterizing a separation:

k': retention factor: a measure for the position of a sample peak in the chromatogram. The retention factor is specific for a given compound and constant under constant conditions.

$$k'_i = \frac{t_{R_i} - t_0}{t_0}$$

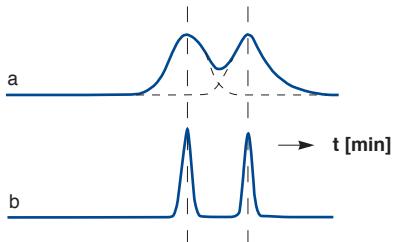

# Basic principles of capillary GC

- α: relative retention, also called separation factor or selectivity coefficient, is the ratio of two capacity factors. The reference substance is always in the denominator.

$$\alpha = \frac{k'_2}{k'_1}$$

The relative retention does not provide any information on the quality of a separation. For equal values of α two very broad peaks may overlap (as shown in a), or may be completely resolved (as in b), if they are accordingly narrow.

$w_{1/2}$ : peak width at half height

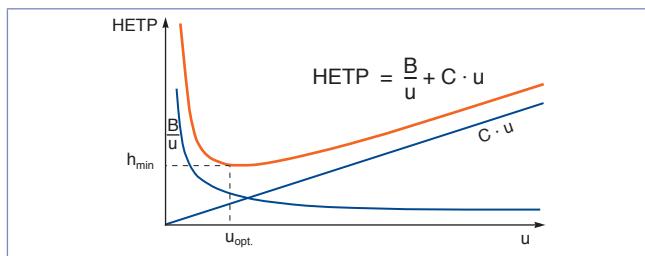

- R: resolution: a measure for the quality of a separation, taking  $w_{1/2}$  into account according to

$$R = \frac{t_{R_2} - t_{R_1}}{(w_{1/2})_2 + (w_{1/2})_1}$$

- N<sub>th</sub>: number of theoretical plates: characterizes the quality of a column (should be determined for k' > 5). The height equivalent to a theoretical plate (h, HETP) is calculated by dividing the length L of the column by the number of theoretical plates N<sub>th</sub>. The smaller this value the more efficient the column.

$$N_{th} = 5.54 \cdot \left( \frac{t_{R_i}}{w_{1/2}} \right)^2 \quad h = HETP = \frac{L}{N_{th}}$$

The Golay equation shows how the plate height h depends on the flow velocity u:

- B molecular axial diffusion; B is a function of the diffusion coefficient of the component in the respective carrier gas

- C resistance to mass transfer

In practice often higher velocities than  $u_{opt.}$  are chosen, if separation efficiency is sufficient. Higher carrier velocities mean shorter retention times.

## Parameters characterizing a capillary column

OPTIMA® 5, 1.0 µm film 30 m x 0.32 mm ID

A      B      C      D

### A. Stationary phase

Different chemical structures of stationary phases are responsible for the type of interaction (selectivity) between the phase and the analytes. The stationary phase also limits the temperature range for chromatography. For a detailed summary of MN phases for GC please see the following chapter.

### B. Film thickness

ranges from 0.1 to 5.0 µm. The standard film thickness is 0.25 µm. Thin films (0.1–0.2 µm) are very well suited for high-boiling, temperature-sensitive or almost contemporaneously eluting substances. Increasing the film thickness will increase the capacity, the retention for low-boiling substances and the inertness of the column. This is especially helpful for samples with a broad range of concentrations, or the separation of volatile polar substances.

A better coverage of the column wall by a thicker film and a reduced column surface due to a shorter columns have a positive impact on the separation of very active substrates, that may cause noticeable tailing when they come in contact with non-coated spots of the column wall.

Thick films, however, always mean more stationary phase in the column, hence increased column bleeding. Therefore, maximum operating temperatures for thick-film columns are reduced. In addition, thick-film columns may have a lesser separating capacity.

### C. Column length

The separating efficiency (better the number of plates N) of a column is directly proportional to its length. Most routine separations are carried out on 25 or 30 m columns, while more complex samples may require 50 or 60 m. 10 m columns are common for Fast GC (see page 267).

### D. Inner diameter (ID)

The lower the ID, the higher is the theoretically possible number of plates per meter;

**0.1–0.2 mm ID:** for high resolution and short retention times at low carrier gas flow

**0.25 mm ID:** for analyses of complex mixtures

**0.32 mm ID:** for routine analyses with short retention times, but increased capacity

**0.53 mm ID:** for rapid separations with inert surface and highest capacity

# Summary of MN phases for GC

MN offers more than 40 different phases for gas chromatography, from very nonpolar to polar columns.

Nonpolar stationary phases (e.g., 100% dimethylpolysiloxane phases) separate by volatility (i.e. boiling point) only. Typical analytes are linear hydrocarbons (*n*-alkanes).

Polar phases offer additional interactions that may improve a separation. When the polarity is increased, e.g., by introducing phenyl and / or cyanopropyl groups, differences in dipole moment and charge transfer effects, e.g., in 5–50% diphenylpolysiloxane phases, gain more and more influence on the separation. Typical analytes are hydrocarbons containing oxygen, sulfur, nitrogen, phosphorus or halogens, as well as unsaturated, polarizable molecules and aromatics.

For the separation of components with various abilities to form strong hydrogen bonds, polyethylene glycol phases (WAX) are the best choice. Typical analytes are alcohols and carboxylic acids.

The selectivity of a column has to be optimized for either the critical pair of components, or the main constituent. Always select the least polar column your separation works on. About 70% of all separations can be accomplished on non- to midpolar columns. These columns generally show a high temperature stability.

For GC columns for special separations, please go to page 266.

<sup>1</sup> First temperature for isothermal operation, second value for short isotherms in a temperature program  
Please note that for columns with 0.53 mm ID and for columns with thicker films temperature limits are generally lower.  
For details refer to the description of individual phases.

<sup>2</sup> Phases which provide a similar selectivity based on chemical and physical properties

<sup>3</sup> See description on page 241

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. A standard test mixture is included with every column.

On request, all columns can be supplied on a **5 inch (13 cm) cage** for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

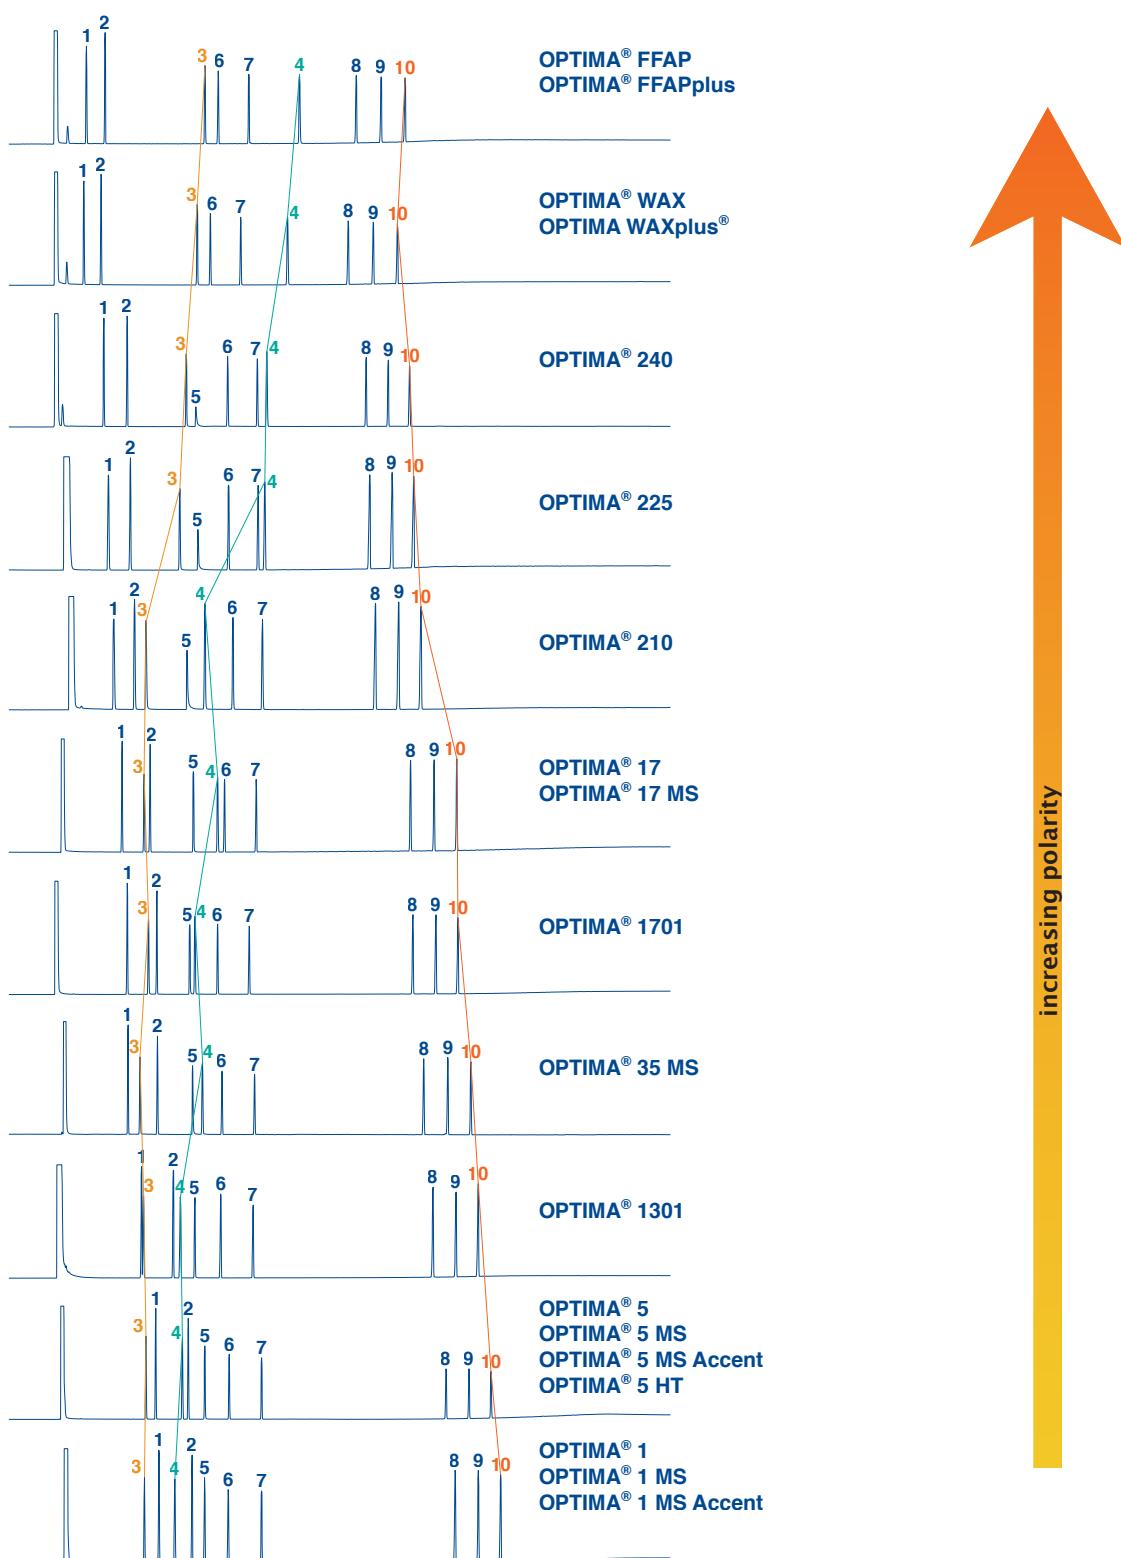

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an **integrated guard column**. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

Capillary columns for GC

# Separation properties of OPTIMA® phases

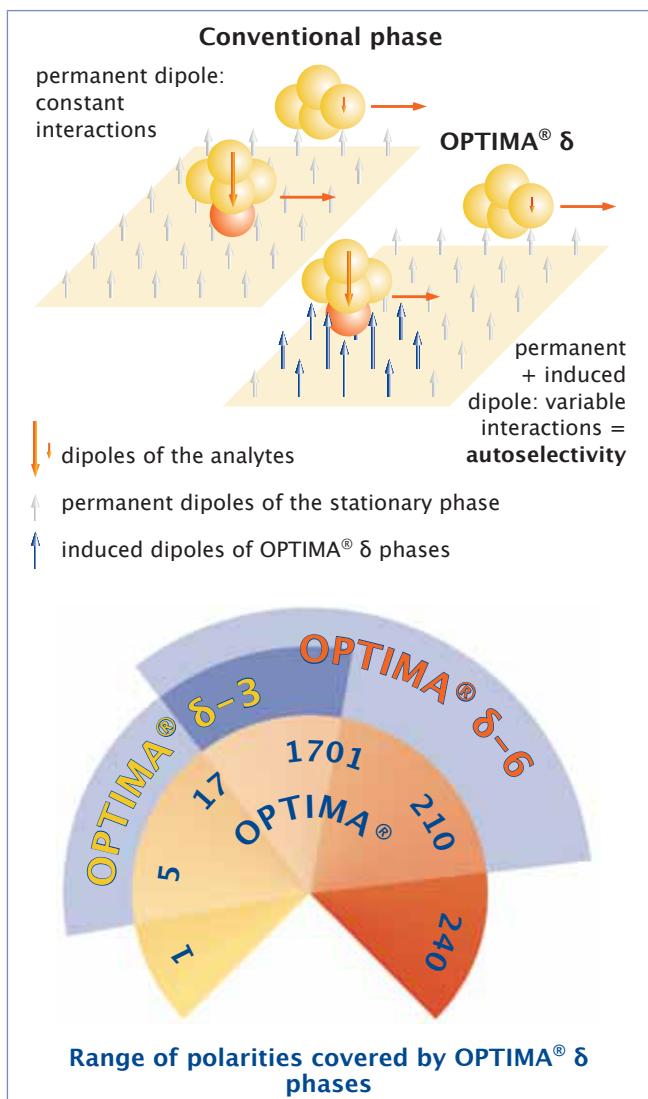

Capillary columns for GC

All columns: 0.25 µm film, 30 m x 0.25 mm ID  
Sample: MN OPTIMA® test mixture (REF 722316)  
Injection: 1.0 µL, split 15 mL/min  
Carrier gas: 0.80 bar He  
Temperature: 80 °C → Tmax (isothermal), 8 °C/min (20 min Tmax)  
Detector: FID 260–280 °C

Peaks:  
1. Undecane  
2. Dodecane  
3. Octanol  
4. Dimethylaniline  
5. Decylamine

6. Methyl decanoate  
7. Methyl undecanoate  
8. Hendicosane  
9. Docosane  
10. Tricosane

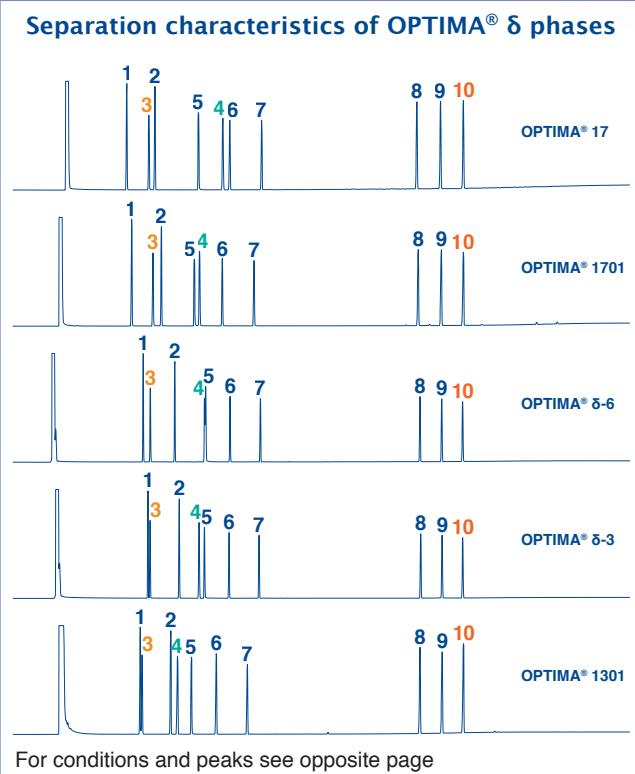

All stationary GC phases can be classified by their polarities. While the selectivity of common GC phases is generally determined by permanent dipole-dipole interactions, OPTIMA® δ-3 and OPTIMA® δ-6 show an additional feature. Large, polarizable groups in the polymer chain of the stationary phase enable the analyte to induce a further dipole moment that increases with the polarity of said analyte. We call this phenomenon "Autoselectivity", because the column adjusts itself to the polarity of the analyte. The implemented polymers consist of cross-linked polysiloxanes with a defined composition and an extremely narrow distribution of molecular weight.

OPTIMA® δ phases cover broad ranges of polarities. Compared with conventional phases, OPTIMA® δ-3 polarity ranges from approximately the nonpolar OPTIMA® 5 to the midpolar OPTIMA® 1701, while for OPTIMA® δ-6 the polarity covers a range from about the midpolar OPTIMA® 17 to the polar OPTIMA® 210.

OPTIMA® δ phases show high temperature limits (340 / 360 °C), as well as low bleed levels, which makes them ideal for the use with mass selective (MSD) or phosphorus/nitrogen detectors (PND) in the field of environmental trace analysis.

Isomeric phenols, such as chloro- and nitrophenols, are difficult to analyze with standard GC phases (e.g., OPTIMA® 5 or OPTIMA® 17) because of co-elutions. The autoselective OPTIMA® δ-3 is able to separate all 22 phenols due to stronger interactions occurring with more polar molecules, because polar analytes induce a dipole moment in the phase of the OPTIMA® δ-3 (see chromatogram page 249).

#### Key features of OPTIMA® δ phases:

- ◆ Wide range of application due to autoselectivity
- ◆ Outstanding thermal stability similar to nonpolar phases
- ◆ Low bleed levels
- ◆ Medium polar without CN groups

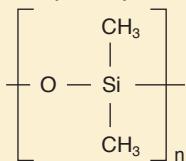

For ordering information of OPTIMA® δ phases see pages 249–250.

In addition to this standard program we will be happy to supply columns custom-made to your specifications.

On request, all columns can be supplied on a 5 inch (13 cm) cage for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an **integrated guard column**. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

# OPTIMA® high performance capillary columns

## OPTIMA® 5 MS Accent

Chemically bonded, cross-linked silarylene phase with polarity similar to a 5% diphenyl - 95% dimethylpolysiloxane phase

**Increased sensitivity due to an unmatched low background level**

USP G27 / G36

### silarylene phase

Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C,

Columns with films > 0.5 µm: max. temperatures 320 and 340 °C, respectively

Lowest column bleed, nonpolar phase, ideal for ion trap and quadrupole MS detectors

Solvent rinsing for removal of impurities applicable

Recommended application: all-round phase for environmental analyses, trace analyses, EPA methods, pesticides, PCB, food and drug analyses

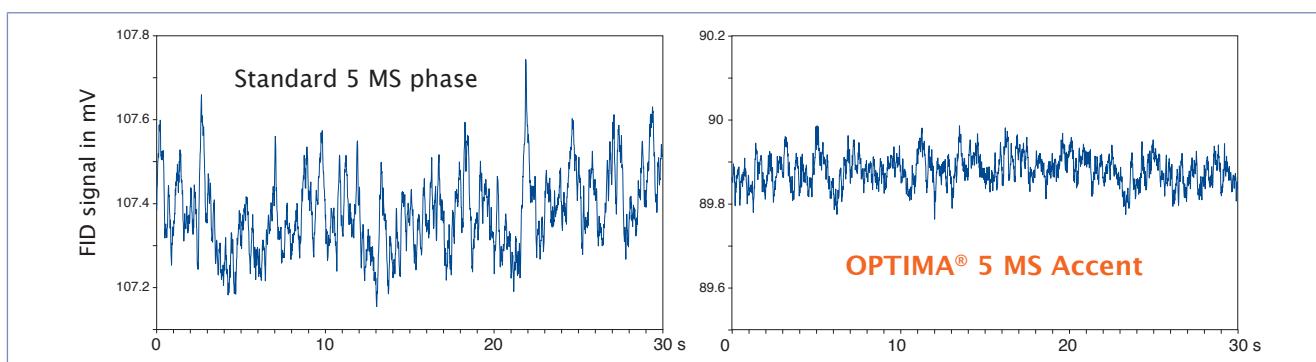

Similar phases:

DB-5 MS, HP-5 MS, Ultra-2, Equity-5, CP-Sil 8 CB low bleed/MS, Rxi-5 MS, Rtx-5SIL-MS, Rtx-5 MS, 007-5 MS, BPX5, MDN-5S, AT-5 MS, VF-5 MS

The bleed comparison test of OPTIMA® 5 MS Accent with a conventional 5 MS phase shows the outstanding performance of the silarylene phase.

Background noise at 340 °C

The unmatched low background level of the OPTIMA® 5 MS Accent, which is approximately three times lower compared to a 5 MS brand column, provides significantly increased sensitivity and allows its application in trace analyses particularly of high-boiling compounds.

In addition to this standard program we will be happy to supply columns custom-made to your specifications.

On request, all columns can be supplied on a 5 inch (13 cm) cage for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

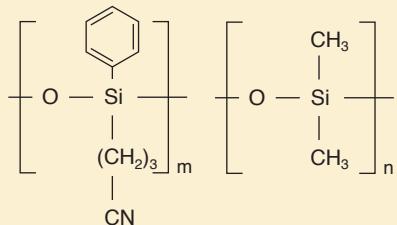

# OPTIMA® high performance capillary columns

## OPTIMA® 1701

14 % cyanopropyl-phenyl – 86 % dimethylpolysiloxane

- Medium polar phase

Similar phases: OV-1701, DB-1701, CP-Sil  
19 CB, HP-1701, Rtx-1701, SPB-1701,  
007-1701, BP10, ZB-1701

Max. temperature for isothermal operation 300 °C,  
max. temperature for short isotherms in a temperature  
program 320 °C  
0.53 mm ID columns:  
max. temperatures 280 and 300 °C, resp.

- Special selectivity due to high cyanopropyl content  
Reference column for structure identification, e.g.,  
in combination with OPTIMA® 5  
Film thickness ≥ 1 µm for solvent analyses
- USP G46

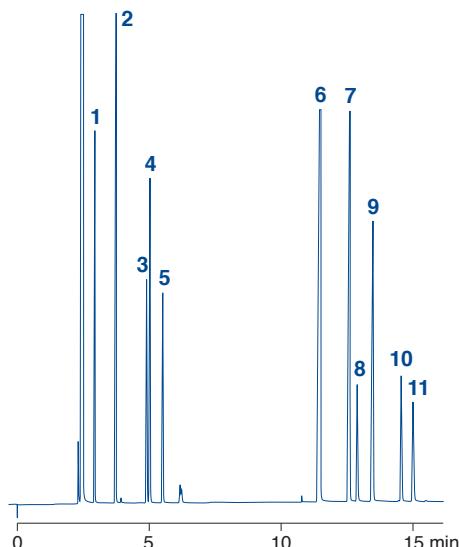

### Analysis of aromatic hydrocarbons

Column: OPTIMA® 1701, 0.25 µm film, 25 m x 0.32 mm ID  
Injection: 1 µL, split 1:40  
Carrier gas: 0.6 bar N<sub>2</sub>  
Temperature: 60 °C → 120 °C, 4 °C/min  
Detector: FID 260 °C

#### Peaks:

- Benzene
- Toluene
- Ethylbenzene
- p-Xylene
- o-Xylene
- Phenol
- 2-Methylphenol
- 2,6-Dimethylphenol
- 4-Methylphenol
- 2,4-Dimethylphenol
- 2,4,6-Trimethylphenol

MN Appl. No. 200400

Capillary columns for GC

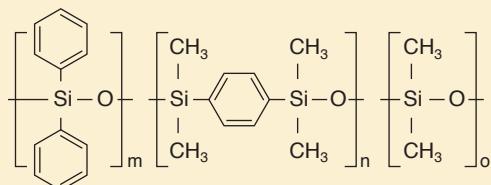

# OPTIMA® high performance capillary columns

## OPTIMA® 35 MS

Chemically bonded cross-linked silarylene phase with selectivity similar to 35% phenyl - 65% methyl polysiloxane

Similar phases: DB-35 MS, HP-35, SPB-35, Rxi-35SIL MS, Rtx-35, 007-35, BPX-35, MDN-35, AT-35 MS, ZB-35, OV-11, VF-35 MS

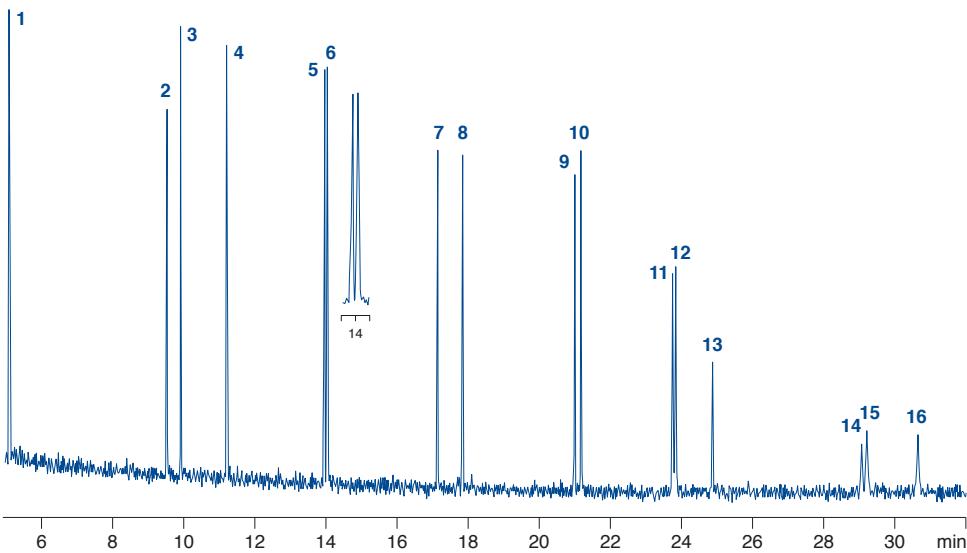

### silarylene phase

- Max. temperature for isothermal operation 360 °C, max. temperature for short isotherms in a temperature program 370 °C,
- Very low column bleeding, medium polar phase, recommended for ion-trap detectors
- Optimum column for confirmation of analytical results in combination with a 1 MS or 5 MS
- Polymer without CN groups
- Recommended application: allround phase for environmental analyses, ultra trace analyses, EPA methods, pesticides, PCB, food and drug analyses
- USP G42

## Capillary columns for GC

### PAH in accordance with EPA 610

Column: OPTIMA® 35 MS, 0.25 µm film, 30 m x 0.25 mm ID  
 Injection: 1 µL, split 1:10  
 Carrier gas: 0.6 bar H<sub>2</sub>  
 Temperature: 100 °C (3 min) → 300 °C (10 min), 6 °C/min  
 Detector: MSD

#### Peaks:

1. Naphthalene
2. Acenaphthylene
3. Acenaphthene
4. Fluorene
5. Phenanthrene
6. Anthracene
7. Fluoranthene
8. Pyrene
9. Benz[a]anthracene

On request, all columns can be supplied on a 5 inch (13 cm) cage for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

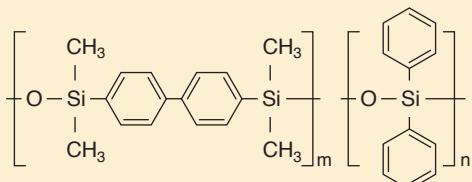

Capillary columns for GC

# OPTIMA® high performance capillary columns

## OPTIMA® 17 MS

- Medium polar silarylene phase with selectivity analogue to 50% phenyl – 50% methylpolysiloxane

Similar phases: OV-17, AT-50, BPX-50, DB-17, DB-17ms, HP-50+, HP-17, SPB-50, SPB-17, SP-2250, Rtx-50, CP-Sil 24 CB, 007-17, VF-17ms, ZB-50

### silarylene phase

- Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C
- Ideal for ion trap detectors
- Optimum reference column in combination with a 1 MS or 5 MS
- No CN groups in the polymer
- Recommended application: all-round phase for environmental analyses, ultra-trace analyses, EPA methods, pesticides, PCBs, food and drug analyses
- USP G3

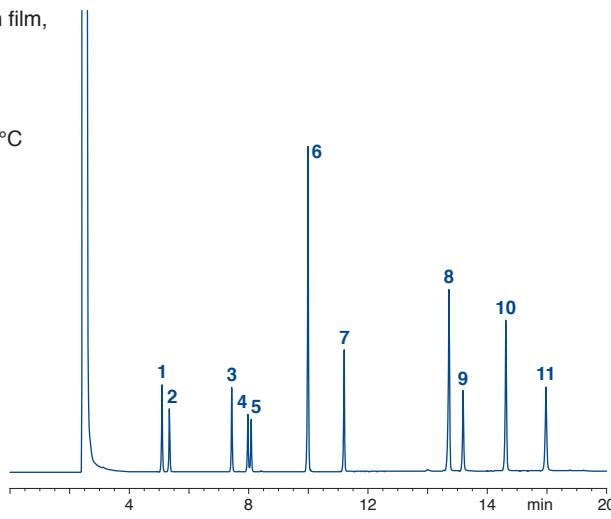

## Capillary columns for GC

### Analysis of phenols

Column: OPTIMA® 17 MS, 0.25 µm film, 30 m x 0.25 mm ID  
Sample: phenol mix 604  
Injection: 1.0 µL, 230 °C, split 1:30  
Carrier gas: He, 0.8 bar  
Temperature: 100 °C, 10 °C/min → 250 °C  
Detector: FID 280 °C

#### Peaks:

1. Phenol
2. 2-Chlorophenol
3. 2,4-Dimethylphenol
4. 2-Nitrophenol
5. 2,4-Dichlorophenol
6. 4-Chloro-3-methylphenol
7. 2,4,6-Trichlorophenol
8. 4-Nitrophenol
9. 2,4-Dinitrophenol
10. 2-Methyl-4,6-dinitrophenol
11. Pentachlorophenol

MN Appl. No. 213600

### Ordering information

	Length →	30 m	60 m
<b>0.25 mm ID (0.4 mm OD)</b>			
0.25 µm film		726162.30	726162.60
<b>0.32 mm ID (0.5 mm OD)</b>			
0.25 µm film		726165.30	726165.60

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. A standard test mixture is included with every column.

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an **integrated guard column**. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

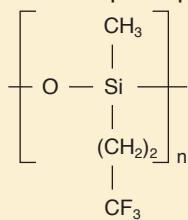

# OPTIMA® high performance capillary columns

## OPTIMA® 210

trifluoropropyl-methylpolysiloxane (50% trifluoropropyl)

- Medium polar phase

Max. temperature for isothermal operation  
260 °C, max. temperature for short isotherms  
in a temperature program 280 °C

- Recommended application: environmental analyses, especially for *o*-, *m*- and *p*-substituted aromatic hydrocarbons
- Close equivalent to USP G6

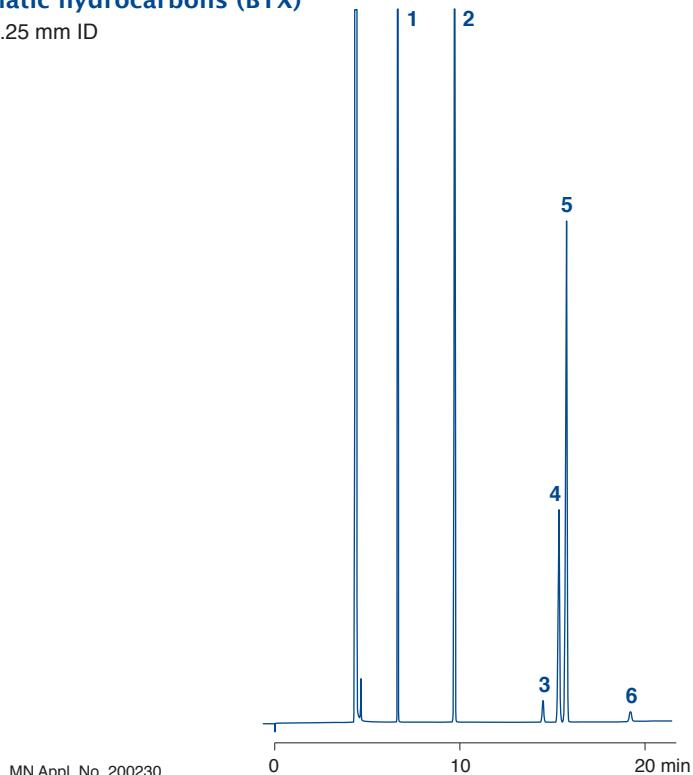

Similar phases: OV-210, DB-210, Rtx-200, 007-210

### Aromatic hydrocarbons (BTX)

Column: OPTIMA® 210, 0.5 µm film, 50 m x 0.25 mm ID  
Injection: 0.5 µL, split 105 mL/min  
Carrier gas: 130 kPa N<sub>2</sub> (1.1 mL/min)  
Temperature: 50 °C  
Detector: FID 250 °C

**Peaks:**

1. Benzene
2. Toluene
3. Ethylbenzene
4. *p*-Xylene
5. *m*-Xylene
6. *o*-Xylene

In addition to this standard program we will be happy to supply columns custom-made to your specifications.		

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. A standard test mixture is included with every column.

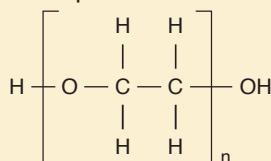

Capillary columns for GC

# OPTIMA® high performance capillary columns

## OPTIMA® FFAP

- Polar phase

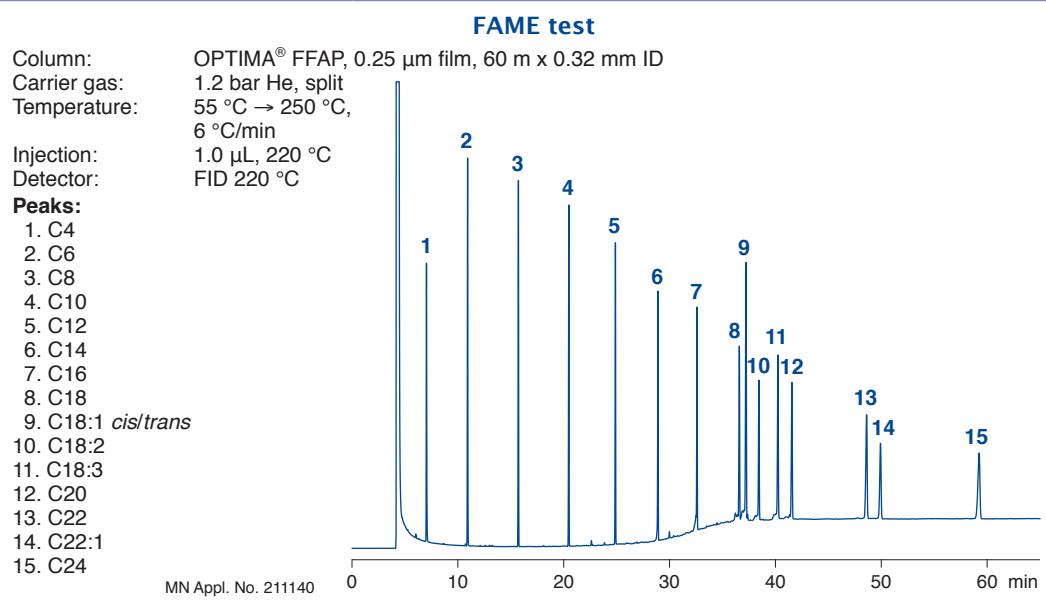

Similar phases: PERMABOND® FFAP (page 265), DB-FFAP, HP-FFAP, CP-Wax 58 (FFAP) CB, 007-FFAP, CP-FFAP CB, Nukol, BP21

## polyethylene glycol 2-nitroterephthalate

Columns with 0.10–0.32 mm ID: max. temperature for isothermal operation 240 °C, max. temperature for short isotherms in a temperature program: 250 °C  
0.53 mm ID columns: max. temperatures 220 and 240 °C, resp.

- Recommended application:  
fatty acid methyl esters (FAMEs), free carboxylic acids
- USP G35 / close equivalent to G25

In addition to this standard program we will be happy to supply columns custom-made to your specifications.					

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an **integrated guard column**. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

# Capillary columns for special separations

## Columns for Fast GC

- ◆ **Characteristics of Fast GC:** decreased column diameters, high heating rates and decreased column lengths for faster GC separations with high resolution efficiency; small inner diameters combined with very fast temperature programs can reduce the analysis time by up to 80 %
- ◆ High heating rates place special demands on stationary phases: OPTIMA® columns meet exactly this requirement: very low bleeding, long lifetimes, even for continuous high heating rates
- ◆ **System requirements for Fast GC:** high sensitivity detectors with small volume and very short response time, as well as very rapid data acquisition and processing · small inner diameters result in high column inlet pressures and a lower volume flow of the mobile phase: very fast injection of very small samples against a high pressure · amount of sample, which can be injected, is limited by the inner diameter and the thin film

### Comparison of a separation on a 50 m standard capillary with separation on a 10 m fast GC column

#### A) Fast GC column

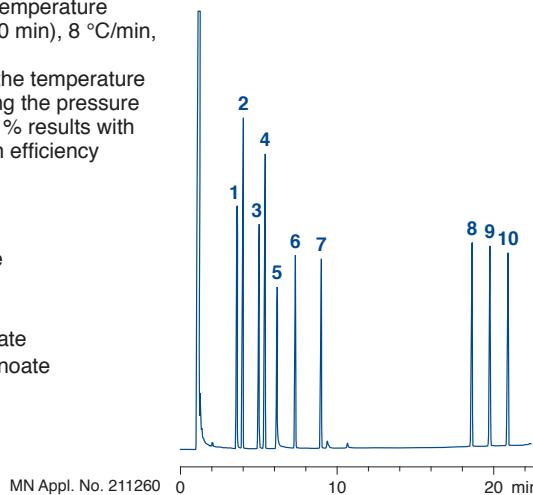

Column: OPTIMA® 5, 0.1 µm film, 10 m x 0.1 mm ID  
injection 1 µL, split 1:40, carrier gas 0.75 bar He

Both separations: temperature  
80 °C → 320 °C (10 min), 8 °C/min,  
detector: FID

While maintaining the temperature  
program and halving the pressure  
a time saving of 30 % results with  
identical separation efficiency

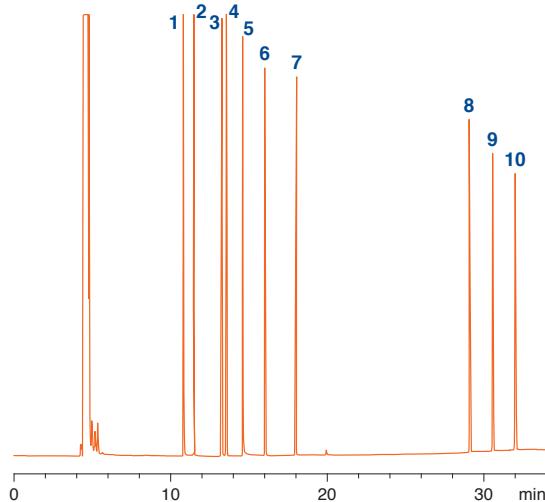

#### Peaks:

1. Octanol
2. Undecane
3. Dimethylaniline
4. Dodecane
5. Decylamine
6. Methyl decanoate
7. Methyl undecanoate
8. Henicosane
9. Docosane
10. Tricosane

#### B) standard GC column

Column: OPTIMA® 5, 0.25 µm film, 50 m x 0.25 mm ID  
injection 1 µL, split 1:35, carrier gas 1.5 bar He

MN Appl. No. 211260

In addition to this standard program, all MN GC phases can be custom-made as fast GC columns.

Capillary columns for GC

# Capillary columns for enantiomer separation

## LIPODEX®

### cyclodextrin phases for enantiomer separation

- ◆ Base material: cyclic oligosaccharides consisting of six ( $\alpha$ -cyclodextrin), seven ( $\beta$ -cyclodextrin) or eight ( $\gamma$ -cyclodextrin) glucose units bonded through  $\alpha$ -1,4-linkages  
Regioselective alkylation and / or acylation of the hydroxyl groups leads to lipophilic phases with varying enantioselectivity, which are well suited for GC enantiomer analyses  
Important advantage: many compounds can be analyzed without derivatization (however, for certain substances enantioselectivity can be favorably influenced by formation of derivatives)
- ◆ A large number of separations have been achieved, however, it is not possible to make a general prediction, which phase could solve a given separation task. Even for compounds with small structural differences or within homologous series the enantiodifferentiation can be quite different. The descriptions below list some of the typical separations possible with individual phases.
- ◆ Water as solvent is strictly forbidden for all cyclodextrin phases. We recommend to dry the sample with our CHROMAFIX® Dry cartridges (page 47) and to dissolve it in an appropriate nonpolar solvent in any case.

## LIPODEX® A

### hexakis-(2,3,6-tri-O-pentyl)- $\alpha$ -cyclodextrin

- ◆ Recommended application: carbohydrates, polyols, diols, hydroxycarboxylic acid esters, (epoxy-) alcohols, glycerol derivatives, spiroacetals, ketones, alkyl halides

Max. temperature for isothermal operation 200 °C, max. temperature for short isotherms in a temperature program 220 °C

## LIPODEX® B

### hexakis-(2,6-di-O-pentyl-3-O-acetyl)- $\alpha$ -cyclodextrin

- ◆ Recommended application: lactones, diols (cyclic carbonates), aminols, aldols (O-TFA), glycerol derivatives (cyclic carbonates)

Max. temperature for isothermal operation 200 °C, max. temperature for short isotherms in a temperature program 220 °C

## LIPODEX® C

### heptakis-(2,3,6-tri-O-pentyl)- $\beta$ -cyclodextrin

- ◆ Recommended application: alcohols, cyanhydrins, olefins, hydroxycarboxylic acid esters, alkyl halides

Max. temperature for isothermal operation 200 °C, max. temperature for short isotherms in a temperature program 220 °C

## LIPODEX® D

### heptakis-(2,6-di-O-pentyl-3-O-acetyl)- $\beta$ -cyclodextrin

- ◆ Recommended application: amines (TFA), aminols (TFA), trans-cycloalkane-1,2-diols, trans-cycloalkane-1,3-diols (TFA),  $\beta$ -amino acid esters

Max. temperature for isothermal operation 200 °C, max. temperature for short isotherms in a temperature program 220 °C

## LIPODEX® E

### octakis-(2,6-di-O-pentyl-3-O-butyryl)- $\gamma$ -cyclodextrin

- ◆ Recommended application:  $\alpha$ -amino acids,  $\alpha$ - and  $\beta$ -hydroxycarboxylic acid esters, alcohols (TFA), diols (TFA), ketones, pheromones (cyclic acetals), amines, alkyl halides, lactones

Max. temperature for isothermal operation 200 °C, max. temperature for short isotherms in a temperature program 220 °C

## LIPODEX® G

### octakis-(2,3-di-O-pentyl-6-O-methyl)- $\gamma$ -cyclodextrin

- ◆ Recommended application: menthol isomers, ketones, alcohols, carboxylic acid esters, terpenes

Max. temperature for isothermal operation 220 °C, max. temperature for short isotherms in a temperature program 240 °C

# Capillary columns for enantiomer separation

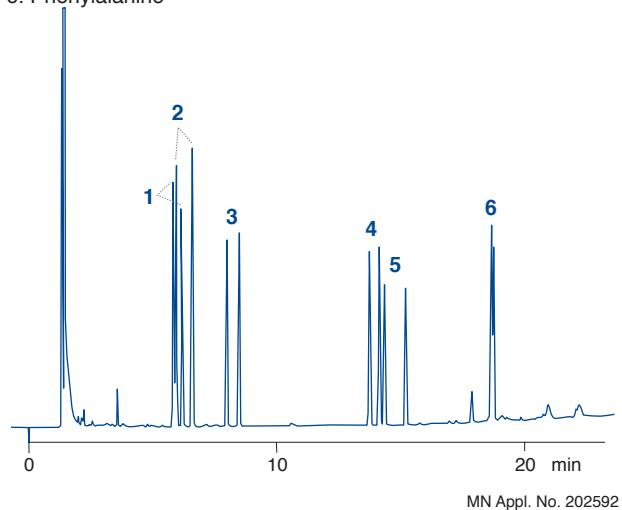

## Enantiomer separation of amino acid methyl esters (TFA)

Column: FS-LIPODEX® E, 25 m x 0.25 mm ID  
 Volume: 1 µL, split ~ 1:100  
 Carrier gas: 60 kPa H<sub>2</sub>  
 Temperature: 90 → 190 °C, 4 °C/min  
 Detector: FID 250 °C

### Peaks:

(D is eluted before L except for proline: L before D)

1. Alanine
2. Valine
3. Leucine
4. Proline
5. Aspartic acid
6. Phenylalanine

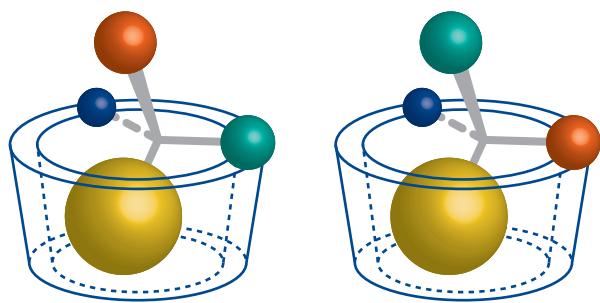

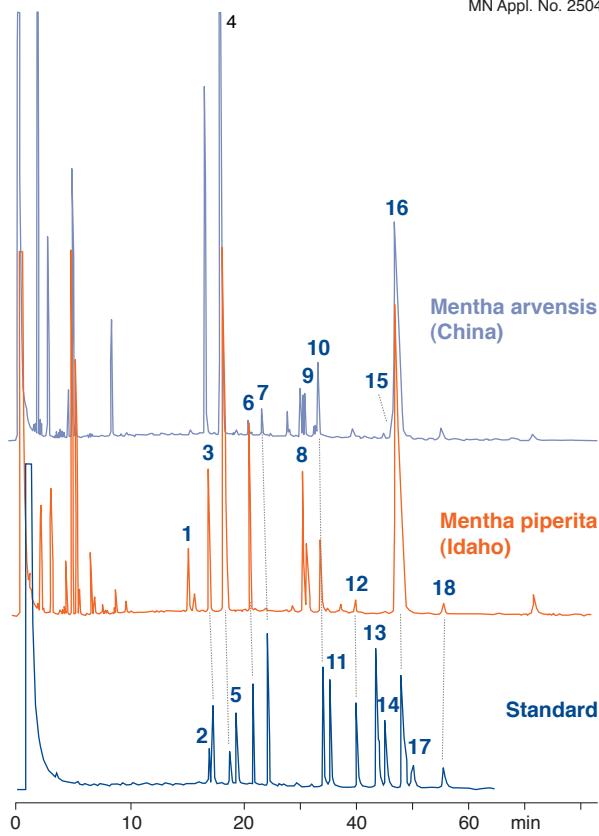

## Separation of chiral constituents of peppermint oil

W. A. König et al., High Resol. Chromatogr. **20** (1997) 55–61  
 Column: FS-LIPODEX® G, 25 m x 0.25 mm ID

## HYDRODEX

## cyclodextrin phases for enantiomer separation

Cyclodextrin derivatives with high melting point: for GC enantiomer separation diluted with polysiloxanes

### HYDRODEX $\beta$ -PM

Phase diluted with optimized polysiloxane

- Recommended application: hydroxycarboxylic acid esters, alcohols, diols, olefins, lactones, acetals

### heptakis-(2,3,6-tri-O-methyl)- $\beta$ -cyclodextrin (CD)

Max. temperature for isothermal operation  
230 °C, max. temperature for short isotherms in a temperature program 250 °C

### HYDRODEX $\beta$ -3P

Phase diluted with optimized polysiloxane

- Recommended application: terpenes, dienes, allenes, terpene alcohols, 1,2-epoxyalkanes, carboxylic acids (esters), hydroxycarboxylic acid esters, pharmaceuticals, pesticides

### heptakis-(2,6-di-O-methyl-3-O-pentyl)- $\beta$ -CD

Max. temperature for isothermal operation  
230 °C, max. temperature for short isotherms in a temperature program 250 °C

### HYDRODEX $\beta$ -6TBDM

Phase diluted with optimized polysiloxane

- Recommended application:  $\gamma$ -lactones, cyclopentanones, terpenes, esters, tartrates

### heptakis-(2,3-di-O-methyl-6-O-t-butyldimethyl-silyl)- $\beta$ -CD

Max. temperature for isothermal operation  
230 °C, max. temperature for short isotherms in a temperature program 250 °C

### HYDRODEX $\beta$ -TBDAc

Phase diluted with optimized polysiloxane

- Recommended application: alcohols, esters, ketones, aldehydes,  $\delta$ -lactones etc.

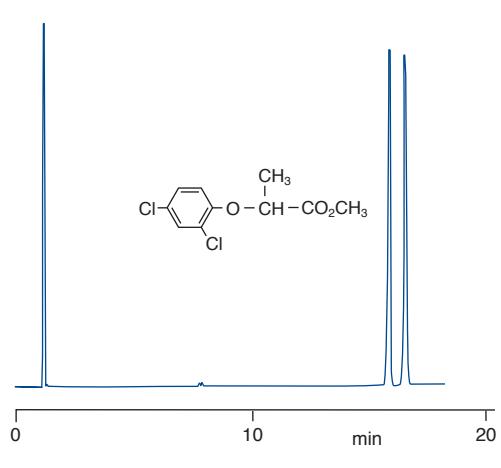

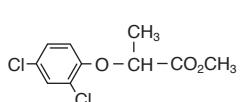

### heptakis-(2,3-di-O-acetyl-6-O-t-butyldimethyl-silyl)- $\beta$ -CD

Max. temperature for isothermal operation  
220 °C, max. temperature for short isotherms in a temperature program 240 °C

#### Enantiomer separation of dichlorprop methyl ester

Column: HYDRODEX  $\beta$ -3P, 25 m x 0.25 mm ID  
Injection: 0.1  $\mu$ L (~1 % in  $\text{CH}_2\text{Cl}_2$ ), split 130 mL/min  
Carrier gas: 60 kPa  $\text{H}_2$  (1.9 mL/min)  
Temperature: 160 °C  
Detector: FID 250 °C

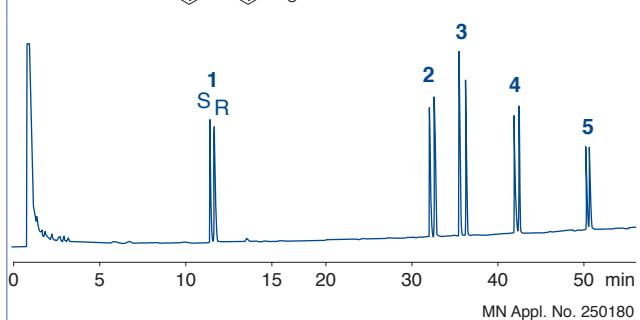

#### Separation of isomeric antiinflammatory drugs

Courtesy of Prof. W.A. König, Hamburg, Germany  
Column: HYDRODEX  $\beta$ -6TBDM, 25 m x 0.25 mm ID  
Carrier gas: He  
Temperature: 135 °C → 200 °C, 1 °C/min  
Detector: FID

##### Peaks:

1. Ibuprofen		4. Naproxen	
2. Flurbiprofen		5. Ketoprofen	
3. Fenoprofen			

# Capillary columns for enantiomer separation

## HYDRODEX $\gamma$ -TBDAc

Phase diluted with optimized polysiloxane

- Recommended application: cyclic ketones, aromatic ketones, oxiranes, aromatic esters, aromatic amides etc.

Max. temperature for isothermal operation  
220 °C, max. temperature for short iso-therms in a temperature program 240 °C

## HYDRODEX $\gamma$ -DiMOM

octakis-(2,3-di-O-methoxymethyl-6-O-t-butyldimethylsilyl)- $\gamma$ -CD

Phase diluted with optimized polysiloxane

- Recommended application: ketones, terpenes, cyclic ethers, alcohols, amines

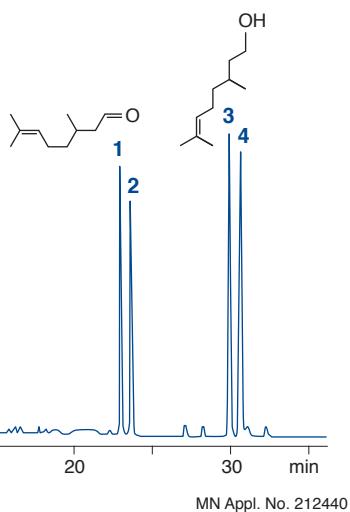

Max. temperature for isothermal operation  
220 °C, max. temperature for short iso-therms in a temperature program 240 °C

### Separation of (R/S) citronellol + citronellal

Column: FS-HYDRODEX  $\beta$ -TBDAc, 50 m x 0.25 mm ID  
Injection: 1  $\mu$ L, 1:1000 in CH<sub>2</sub>Cl<sub>2</sub>, split 25 mL/min  
Carrier gas: 1.5 bar H<sub>2</sub>  
Temperature: 100 °C  
Detector: FID 220 °C

#### Peaks:

- (R)/(S)-Citronellal
- (S)/(R)-Citronellal
- (S)-Citronellol
- (R)-Citronellol

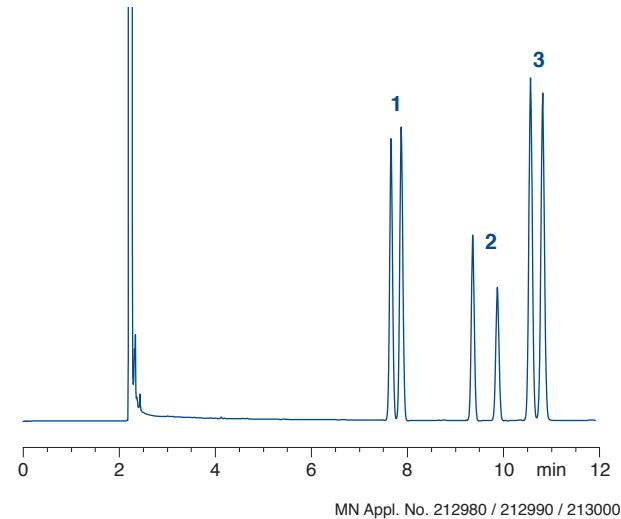

### Separation of essential oils

Column: FS-HYDRODEX  $\gamma$ -TBDAc, 50 m x 0.25 mm ID  
Injector: 220 °C  
Carrier gas: 1.2 bar H<sub>2</sub>  
Temperature: 125 °C  
Detector: FID 220 °C

#### Peaks:

- Fenchone (1.5 mg/mL)
- Menthone (0.5 mg/mL)
- Menthol (2 mg/mL)

Capillary columns for GC

# Capillary columns for analysis of biodiesel

## OPTIMA® BioDiesel

for the analysis of biodiesel (DIN EN 14214 / ASTM D 6751)

### OPTIMA® BioDiesel M

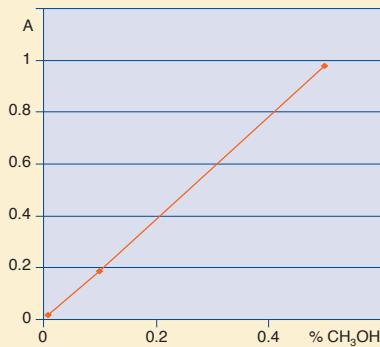

for analysis of methanol in accordance with DIN EN 14110

The methanol content in biodiesel as specified in DIN EN 14110 must not exceed 0.2%. The column OPTIMA® BioDiesel M allows the GC headspace analysis of the methanol content in biodiesel in the concentration range from 0.01 to 0.5% with 2-propanol as internal standard. The graph on the right shows the linearity of the determination in the required range ( $A = \text{area}[\text{methanol}]/\text{area}[2\text{-propanol}]$ ).

Similar phases: Select™ Biodiesel for Methanol, Trace TR-BioDiesel (M)

Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C

### OPTIMA® BioDiesel F

for analysis of FAMEs in accordance with DIN EN 14103:2011

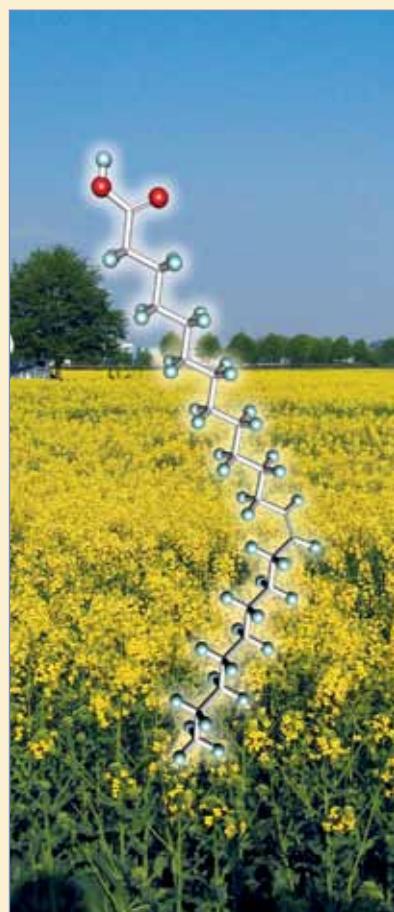

The analysis of biodiesel requires separation of typical FAMEs between myristic acid (C14) and nervonic acid (C24:1) methyl esters. This analysis is possible on OPTIMA® BioDiesel F in only 22 min. Additionally, linolenic acid methyl ester can be determined due to the good resolution.

The extended standard DIN EN 14103:2011 also covers smaller FAMEs starting from C6 (see application 214510 on opposite page). Change of the internal standard from C17 to C19 also allows the analysis of animal fats.

Similar phases: Select™ Biodiesel for FAME, Trace TR-BioDiesel (F)

Max. temperature for isothermal operation 240 °C, max. temperature for short isotherms in a temperature program 250 °C

### OPTIMA® BioDiesel G

for analysis of glycerol and glycerides in accordance with DIN EN 14105

The capillary column OPTIMA® BioDiesel G allows determination of free glycerol and residues of mono-, di- and triglycerides in FAMEs intended as additives for mineral oils. The procedure can be applied for FAMEs from rapeseed oil, sunflower oil and soy bean oil. Glycerol as well as mono- and diglycerides are derivatized to more volatile substances by addition of MSTFA (see page 286) in the presence of pyridine.

Similar phases: Select™ Biodiesel for Glycerides, Trace TR-BioDiesel (G), MET-Biodiesel

Max. temperature for isothermal operation 380 °C, max. temperature for short isotherms in a temperature program 400 °C

# Capillary columns for analysis of biodiesel

## PERMABOND® SE-54-HKW

## for volatile halogenated hydrocarbons

- ◆ SE-54 optimized for volatile halogenated hydrocarbons
- ◆ USP G36

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature program 320 °C

For the analysis of halogenated hydrocarbons, we recommend our optimized column PERMABOND® SE-54-HKW at 25 or 50 m length with our approved polysiloxane phase SE-54. As an alternative, or to verify analytical results, the OPTIMA® 624 has proven itself as advantageous, especially for the determination of 1,1,2-trichlorotrifluoroethane (F 113) along with di-

chloromethane. Both phases are also suited for the determination of vinyl chloride as well as for the separation of *cis/trans* isomers of 1,2-dichloroethene. The high film thickness secures a high capacity and an outstanding resolution. For GC/MS coupling, we recommend OPTIMA® 624 LB or OPTIMA® 624 with 0.2 or 0.25 mm ID.

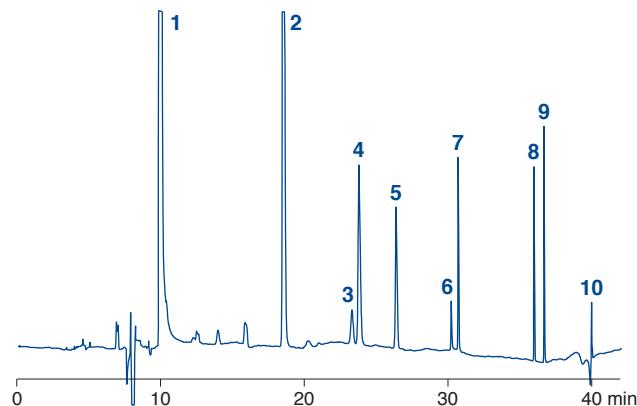

### Volatile halogenated hydrocarbons

Column: PERMABOND® SE-54-HKW, 50 m x 0.32 mm ID  
 Injection: 1 µL, split ~ 1:30

# Fused silica capillaries

## Retention gaps

- The retention gap technique in combination with on-column injection allows to concentrate a large sample volume in the capillary column.

- Choice of the retention gap depends on the solvent used: the flooded zone after injection should be between 20-30 cm/µL

Me-Sil retention gap: only for use with *n*-hexane and diethyl ether

Phe-Sil retention gap: for all solvents except methanol and water

CW retention gap: for all solvents and especially for methanol and water

- Calculation example: length of flooded zone ~ 20-30 cm/µL, retention gap 10 m x 0.32 mm ID, capillary column: 25 m x 0.32 mm ID, max. injection volume ~ 30-50 µL

- A retention gap must be inert without any noticeable retention

Me-Sil retention gaps are more inert than Phe-Sil, while Phe-Sil is less susceptible to contamination

- Max. temperatures: for CW retention gaps 250 °C, for Me-Sil and Phe-Sil retention gaps 320 °C

Retention gaps can also be used as transfer lines or precolumns (contamination capacity about 5-10 µg).

For a considerably longer lifetime, even for contaminated or matrix-containing samples, MN offers the option of **integrated precolumns**. All capillary columns are available with a 10 m guard column with matched deactivation. For ordering, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

# Reagents and procedures for derivatization

## Derivatization reagents

- To improve volatility, increase thermal stability or to achieve a lower limit of detection in gas chromatography  
Prerequisite: quantitative, rapid and reproducible formation of only one derivative  
Halogen atoms inserted by derivatization, e.g., trifluoroacetates, allow the specific detection in an ECD with the advantage of high sensitivity.  
Specific derivatizations may influence elution orders and fragmentation patterns in a MS.
- We provide reagents for **acylation**, **alkylation** (**methylation**), and **silylation**.

## Derivatization method development kits

Designation	Contents of the kit	REF

# Reagents and procedures for acylation

## Reagents for GC

## Acylation reagents

### Acyl halides

By-product of acylation with acyl halides: corresponding hydrohalic acids  
excess of reagent and acid have to be removed or trapped by a suitable base (e.g., pyridine)

#### Pentafluorobenzoyl chloride

**PFBC:**  $C_6F_5 - CO - Cl$

M 230.52 g/mol, Bp 158–159 °C (760 mm Hg),  
density d20°/4° = 1.601

### Anhydrides

By-products of acylation with anhydrides: corresponding acids  
excess reagent and the acid formed are to be removed

#### Trifluoroacetic acid anhydride

**TFAA:**  $CF_3 - CO - O - CO - CF_3$

M 210.04 g/mol, Bp 39.5–40.5 °C (760 mm Hg),  
density d20°/4° = 1.490

#### Heptafluorobutyric acid anhydride

**HFBA:**  $C_3F_7 - CO - O - CO - C_3F_7$

M 410.06 g/mol, Bp 106–107 °C (760 mm Hg),  
density d20°/4° = 1.665

### Bisacylamides

By-products: corresponding neutral acylamides: high volatility · easily removed; due to the neutral conditions and their favorable chromatographic characteristics, the removal of surplus bisacylamides and their by-products is often not necessary. Therefore, the sample preparation is much easier.

#### N-methyl-bis(trifluoroacetamide)

**MBTFA:**  $CF_3 - CO - N(CH_3) - CO - CF_3$

M 223.08 g/mol, Bp 123–124 °C (760 mm Hg),  
density d20°/4° = 1.55

#### N-methyl-bis(heptafluorobutyramide)

**MBHFBA:**  $C_3F_7 - CO - N(CH_3) - CO - C_3F_7$

M 423.1 g/mol, Bp 165–166 °C (760 mm Hg),  
density d20°/4° = 1.673

## Methods for acylation

### Acylation with fluorinated acid anhydrides:

The acylation with TFAA or HFBA, under formation of volatile, stable derivatives for FID or ECD detection, is applicable for alcohols, phenols, carboxylic acids, amines, amino acids and steroids.

#### Procedure:

Dissolve 0.1 to 1 mg sample in 0.1 mL solvent, add 0.1 mL of the anhydride and heat to 60–70 °C for 1–2 h. If the sample need not be concentrated prior to the analysis and if there is no danger of catalytically induced side reactions, pyridine is used as solvent. The reaction solution can be injected directly into the gas chromatograph. Otherwise, use a volatile solvent and evaporate solvent, excess reagent and free acid in a stream of nitrogen. Dissolve residue in 50 µL hexane, chloroform etc. and inject aliquot portions.

TFAA MN Appl. No. 213041 · HFBA MN Appl. No. 213042

### Acylation with fluorinated acid amides:

This method is recommended for alcohols, primary and secondary amines as well as for thiols under mild, neutral conditions. MBTFA also forms very volatile derivatives with carbohydrates [J. Sullivan and L. Schewe, J. Chromatogr. Sci. 15 (1977) 196–197].

#### Procedure:

Add 0.5 mL MBTFA or MBHFBA to about 2 mg sample. If there is no reaction at ambient temperature, heat the reaction mixture to 120 °C. Compounds difficult to dissolve, can be trifluoroacetylated in suitable solvent mixtures. It is recommended to use a ratio of solvent to MBTFA or MBHFBA of 4:1. The reaction mixture is chromatographed directly.

MBTFA MN Appl. No. 213051 · MBHFBA MN Appl. No. 213052

\* These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see MSDS. Due to their purpose, derivatization reagents are very reactive substances. For this reason, they should be stored cool and protected from moisture. For easy access with a syringe, our derivatization reagents are supplied in vials with crimp caps. Vials with pierced sealing disks have limited stability and should be used soon.

# Reagents and procedures for methylation

## Alkylation reagents

Apart from a few exceptions, methylation is the most common alkylation type.

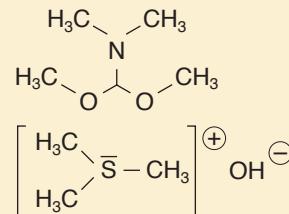

### Methylation reagents

#### N,N-dimethylformamide dimethylacetal

**DMF-DMA** · M 119.17 g/mol, Bp 106–107 °C  
(760 mm Hg), density d<sub>20°/4°</sub> = 0.897

#### Trimethylsulfonium hydroxide

**TMSH** (0.2 mol/L in methanol) · M 94.06 g/mol

## Methods for methylation

### Methylation with TMSH

Methylation with TMSH [W. Butte, J. Chromatogr. **261** (1983) 142] is suited for free acids, chlorophenoxy carboxylic acids, their salts and derivatives as well as for phenols and chlorophenols. The great advantage is the simplification of the sample preparation. Lipids or triglycerides can be converted to the corresponding fatty acid methyl esters (FAMEs) by simple transesterification.

This reaction is very elegant and convenient, because it is only necessary to add the reagent (0.2 mol/L in methanol) to the sample solution. Removal of surplus reagent is not required, since at 250 °C inside the injector of the gas chromatograph, TMSH will pyrolyze solely to volatile methanol and dimethylsulfide. Due to high reactivity, a complete conversion is usually obtained at ambient temperature. Heating (e.g., 10 min at 100 °C) in a closed sample vial may be necessary, however.

#### Procedure:

Dissolve 100 mg sample (e.g., butter) in 5 mL of a solvent (e.g., *tert*-butyl methyl ether). Add 50 µL reagent to 100 µL of this solution. The mixture is injected directly. The temperature of the injector must be at least 250 °C.

MN Appl. No. 213060

For GC separation of FAMEs from natural butter fat after derivatization with TMSH see Appl. 201680 at [www.mn-net.com](http://www.mn-net.com)

### Methylation with DMF-DMA

Methylation with DMF-DMA, under formation of N-dimethyl-aminomethylene amino acid methyl esters, is applicable for fatty acids, primary amines and (partially) amino acids [Thenot et al., Anal. Letters **5** (1972) 217–223, 519–529]. Since DMF-DMA is a poor solvent, it is essential to use a mixture of DMF-DMA with pyridine, THF, acetone (barbiturates) or another solvent.

#### Procedure:

Add 1 mL of a mixture of DMF-DMA and pyridine (1:1) to 1–50 mg fatty acids. The sample can be injected as soon as a clear solution has formed. It is recommended, however, to heat the solution to 60–100 °C for 10–15 min.

MN Appl. No. 213070

### Methylation with methanol – TMCS

A 1-molar solution of TMCS in methanol is suited for the esterification of free carboxylic acids and the transesterification of glycerides. Formation of HCl catalyzes the reaction. TMCS, resp. silyl ethers remove the water and thus drive the reaction to completion. The mixture should be freshly prepared.

#### Procedure:

Add 1 mL methanol – TMCS to about 50 mg carboxylic acid or glyceride and heat. Then evaporate in a stream of nitrogen and dissolve again for injection in, e.g., *n*-heptane.

MN Appl. No. 213080

# Reagents and procedures for silylation

## Silylation reagents

The most common form of silylation in GC is the replacing of active hydrogen atoms with a trimethylsilyl group (TMS derivative). Less frequently, trialkylsilyl groups or dimethylsilyl groups with longer alkyl chains are also in use. The alkylsilyl group increases volatility and enhances thermal stability of the sample.

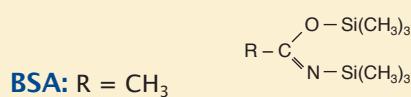

Silylation can be catalyzed either acidic by addition of TMCS or basic by addition of pyridine or TSIM (e.g., for sterically hindered functionalities like *tert.* alcohols).

**Reactivity of silylation reagents** (acc. to M. Donike): TMS amides (e.g., BSA, MSTFA) > TMS amine = TSIM > Enol-O-TMS ether > S-TMS ether > O-TMS ether > TMS-O-TMS

**Stability of the TMS derivatives:** O-TMS ether > S-TMS ether > Enol-O-TMS ether > TMS amine > TMS amide

### BSA · BSTFA · SILYL-991

#### ◆ N,O-bis-trimethylsilyl-acetamide

M 203.4 g/mol, Bp 71–73 °C (35 mm Hg), density d<sub>20</sub>°/4° = 0.832

Strong silylation reagent, creating very stable TMS derivatives of a multitude of compounds, e.g., alcohols, amines, carboxylic acids, phenols, steroids, biogenic amines and alkaloids; not recommended for use with carbohydrates or very low molecular weight compounds; good solvent for polar compounds, but frequently used in combination with a solvent (pyridine, DMF etc.) or with other silylation reagents. Dissolved in DMF, BSA is the prime derivatization reagent for phenols.

#### ◆ N,O-bis-trimethylsilyl-trifluoroacetamide

M 257.4 g/mol, Bp 40 °C (12 mm Hg), density d<sub>20</sub>°/4° = 0.961

Powerful trimethylsilyl donor with approx. the same donor strength as the nonfluorinated analog BSA

Advantage of BSTFA over BSA: greater volatility of its reaction products, particularly useful for GC analysis of low boiling TMS amino acids

BSTFA is nonpolar (less polar than MSTFA) and can be mixed with acetonitrile for improved solubility. For the silylation of fatty acid amides, hindered hydroxyl groups and other difficult to silylize compounds, e.g., secondary alcohols and amines, we recommend BSTFA + 1% trimethylchlorosilane (TMCS), available under the designation SILYL-991.

### Silylation with BSA, BSTFA or SILYL-991 (BSTFA + 1% TMCS)

#### Procedure:

Add 0.5 mL of the silylation reagent to 1–10 mg sample; if necessary, add some solvent (normally pyridine or DMF [dimethylformamide]). Heat to 60–80 °C for 20 min to increase the reaction rate. 1–2 drops of TMCS (trimethylchlorosilane) or TSIM will also speed up the reaction.

BSA MN Appl. No. 213091 · BSTFA MN Appl. No. 213092  
SILYL-991 MN Appl. No. 213093

### Silylation with BSA in combination with other silylation reagents

#### Procedure:

BSA alone silylates all sterically unhindered hydroxyl groups of the steroid skeleton; addition of TMCS will enable reaction of moderately hindered OH groups (reaction time 3–6 h at 60 °C). After addition of TSIM even strongly hindered hydroxyl groups will react (reaction time 6–24 h at 60 °C).

MN Appl. No. 213100

### MSTFA · MSHFBA · MBDSTFA

#### ◆ N-methyl-N-trimethylsilyl-trifluoroacetamide

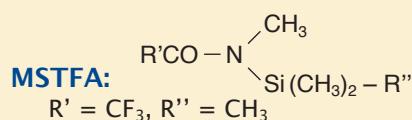

M 199.1 g/mol, Bp 70 °C (75 mm Hg), density d<sub>20</sub>°/4° = 1.11

The most volatile trimethylsilyl amide available

Very strong TMS donor which does not cause noticeable FID fouling even during long-time measuring series. The addition of protic solvents in submolar quantities, e.g., TFA for extremely polar compounds (hydrochlorides) or pyridine for carbohydrates), can improve the already good dissolving power of MSTFA.

Recommended applications: carboxylic acids, hydroxy and ketocarboxylic acids, amino acids, amines, alcohols, polyalcohols, sugars, mercaptans and similar compounds with active hydrogen atoms. Even amine hydrochlorides can be silylated directly.

Advantages: complete conversion with high reaction rates, even without a catalyst (1-2% TMCS or TSIM); the by-product of the reaction (N-methyltrifluoroacetamide) shows a high volatility and a short retention time

#### ◆ N-methyl-N-trimethylsilyl-heptafluorobutyramide

**MSHFBA:**  $\text{R}' = \text{C}_3\text{F}_7, \text{R}'' = \text{CH}_3$

M 299.1 g/mol, Bp 148 °C (760 mm Hg)

Similar to MSTFA in reactivity and chromatography

Recommended applications: carboxylic acids, alcohols, phenols, primary and secondary amines and amino acids; either applied alone or in combination with a catalyst (TMCS, TSIM) or another silylation reagent with or without solvent; the by-product N-methylheptafluorobutyric amide has a lower retention time than the silylating reagent; especially useful for flame ionization detection due to the large ratio of fluorine to silicon of 7:1, since degradation of the surplus MSHFBA does not produce SiO<sub>2</sub> but volatile, non-corrosive silicon compounds

#### ◆ N-methyl-N-tert-butyldimethylsilyl-trifluoroacetamide

**MBDSTFA** (MTB-TFA):  $\text{R}' = \text{CF}_3, \text{R}'' = \text{C}_4\text{H}_9$

M 241.3 g/mol, Bp 168–170 °C (760 mm Hg), density d<sub>20</sub>°/4° = 1.121

Silylation reagent that donates a tert-butyldimethylsilyl group (TBDMS) for derivatizing active hydrogen atoms in hydroxyl, carboxyl and thiol groups as well as primary and secondary amines; fast reactions (typically 5–20 min) with high yields (> 96%); by-products are neutral volatiles

TBDMS ethers are 10<sup>4</sup> times more stable than the corresponding TMS ethers

Due to the large protecting group, chromatographic retention times are longer. This may have a beneficial impact on some separations. The high concentration of M<sup>+</sup>-57 ions is an interesting topic for GC/MS.

### Silylation with MSTFA, MSHFBA or MBDSTFA

#### Procedure:

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 h and can be analyzed directly. If TFA is used as a solvent, proceed as follows [M. Donike, J. Chromatogr. **85** (1973) 1–7]: dissolve 1–2 mg sample in 100 µL TFA. Dropwise add 0.9 mL of the silylating reagent. After cooling the sample can be chromatographed directly.

# Reagents and procedures for silylation

## Reagents for GC

### DMCS · HMDS · TMCS · TSIM

#### ◆ Dimethyldichlorosilane

**DMCS:**  $(\text{CH}_3)_2\text{SiCl}_2$

M 129.06 g/mol, Bp 70 °C (760 mm Hg), density d20°/4° = 1.07

Used to form dimethylsilyl (DMS) derivatives; DMS derivatives are much more susceptible to hydrolysis than TMS derivatives, it is therefore vital to have strictly anhydrous conditions during the conversion.

#### ◆ Hexamethydisilazane

**HMDS:**  $(\text{CH}_3)_3\text{Si} - \text{NH} - \text{Si}(\text{CH}_3)_3$

M 161.4 g/mol, Bp 126 °C (760 mm Hg), density d20°/4° = 0.7742

Weak TMS donor; used as a sole reagent, it is slow and not very effective.

With catalytic quantities, e.g., 1% of, or as a mixture with TMCS (2:1, v/v; SILYL-21 and SILYL-2110) it is perfectly suited for a quick and quantitative trimethylsilylation of organic compounds.

Aprotic solvents like acetonitrile, pyridine, dimethylformamide, carbon disulfide and dimethylacetamide recommend themselves for use with HMDS.

#### ◆ Trimethylchlorosilane

**TMCS:**  $(\text{CH}_3)_3\text{SiCl}$

M 108.7 g/mol, Bp 57 °C (760 mm Hg), density d20°/4° = 0.8580

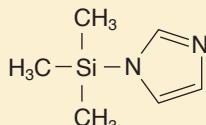

Often used as a catalyst with other trimethylsilyl reagents

As a sole reagent, it can be used to prepare TMS derivatives of organic acids.

#### ◆ N-Trimethylsilyl-imidazole

M 140.3 g/mol, Bp 94–96 °C (760 mm Hg), density d20°/4° = 0.961

**TSIM:**

Strongest hydroxyl silylator; reagent of choice for carbohydrates and most steroids (even strongly hindered steroids)

It is remarkable that TSIM reacts quickly and smooth with hydroxyl (even *tert.* OH) and carboxyl groups, but not with amines. Hence it is especially suited for multiple derivatizations, when compounds with various functional groups are to be derivatized in different ways (e.g., –O-TMS, –N-HFB derivatives of catecholamines).

Recommended applications:

alcohols, phenols, organic acids, steroids, hormones, glycals, nucleotides, narcotics

### Silylation with TSIM or SILYL-1139 (TSIM – pyridine 11:39)

#### Procedure:

Dissolve 10–15 mg sample in 0.8 mL solvent, then add 0.2 mL of the silylation reagent. The reaction mixture can be heated to 60–70 °C for up to 1 hour and can be analyzed directly.

Recommended solvent pyridine

When using SILYL-1139, the presence of water does not interfere.

TSIM MN Appl. No. 213121 · SILYL-1139 MN Appl. No. 213122

# Reagents for GC

## Silylation with SILYL-21 or SILYL-2110

### Procedure:

Carefully add SILYL-21 or SILYL-2110 to 1–10 mg of the sample. Precipitated ammonium chloride does not interfere. If the sample should not dissolve within 5 min, heat to 75–85 °C. If no mutarotation is to be expected, you may dissolve the sugar in warm pyridine first and then add the silylation reagent. In some cases it may be advantageous to use a different solvent instead of pyridine. For derivatization of 3-ketosteroids we recommend to use DMF (dimethylformamide).

SILYL-21 MN Appl. No. 213131 · SILYL-2110 MN Appl. No. 213132

- ◆ Recommended applications: sugars, glycols, sterically unhindered alcohols, carboxylic acids, acids in urine, hydroxy fatty acids, nucleotides, steroids, vitamin D, xanthone derivatives

## O-Trimethylsilylation with MSTFA followed by N-trifluoroacetylation with MBTFA

### Procedure:

Completely silylate 2 mg of the sample with 0.3 mL MSTFA, e.g., as described on page 286. After addition of 0.3 mL MBTFA the N-trimethylsilyl group is replaced by the N-trifluoroacetyl group. The mixture can be analyzed directly.

# Test mixtures for GC capillary columns

## Reagents for GC

### OPTIMA® Amine test mixture (REF 722317)

Column: OPTIMA® 5 Amine, 1.0 µm film, 30 m x 0.32 mm ID  
 Injection: 1 µL, split 1:50  
 Carrier gas: 0.6 bar H<sub>2</sub>  
 Temperature: 100 °C → 290 °C, 10 °C/min  
 Detector: FID 280 °C

#### Peaks:

1. Diisobutylamine
2. Diethanolamine
3. 2,6-Dimethylaniline
4. o-Propanol-pyridine
5. Dicyclohexylamine
6. Dibenzylamine

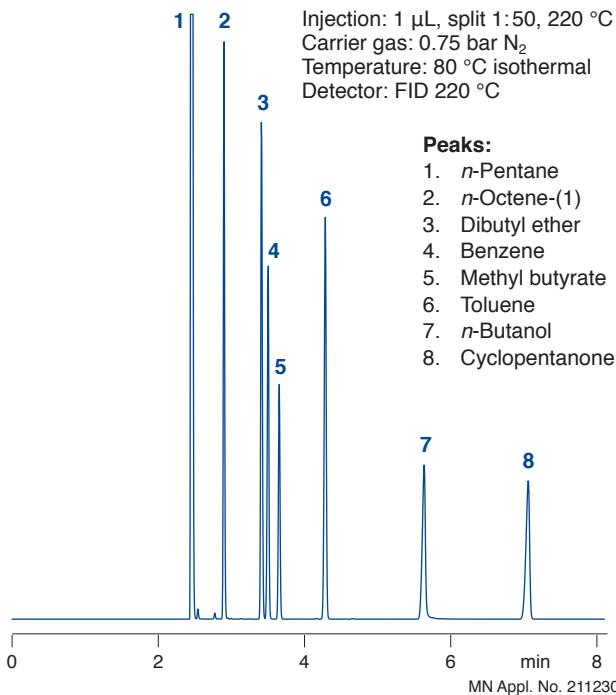

MN Appl. No. 250020

### Polarity mixture POL<sub>5</sub> (qualitative) (REF 722306)

Column: OPTIMA® Wax, 0.25 µm film, 25 m x 0.25 mm ID  
 Injection: 1 µL, split 1:50, 220 °C  
 Carrier gas: 0.75 bar N<sub>2</sub>  
 Temperature: 80 °C isothermal  
 Detector: FID 220 °C

#### Peaks:

1. n-Pentane
2. n-Octene-(1)
3. Dibutyl ether
4. Benzene
5. Methyl butyrate
6. Toluene
7. n-Butanol
8. Cyclopentanone

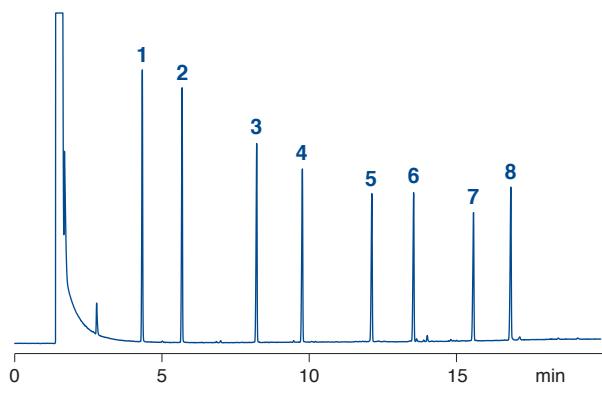

MN Appl. No. 211230

### Activity test mixture (REF 722307)

Column: OPTIMA® 5, 1.0 µm film, 25 m x 0.32 mm ID  
 Injection: 1 µL, split 1:40, 300 °C  
 Carrier gas: 0.6 bar H<sub>2</sub>  
 Temperature: 150 °C → 300 °C (8 min), 10 °C/min  
 Detector: FID 300 °C

#### Peaks:

1. TMS capric acid (C<sub>10</sub>)
2. Hexadecane (C<sub>16</sub>)
3. TMS myristic acid (C<sub>14</sub>)
4. Eicosane (C<sub>20</sub>)
5. TMS stearic acid (C<sub>18</sub>)
6. Tetracosane (C<sub>24</sub>)
7. TMS behenic acid (C<sub>22</sub>)
8. Octacosane (C<sub>28</sub>)

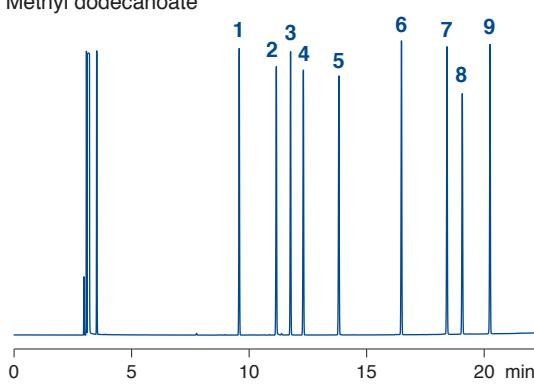

MN Appl. No. 211240

### Grob test mixture (modified) (REF 722310)

Column: OPTIMA® 5, 1.0 µm film, 50 m x 0.25 mm ID  
 Injection: 1 µL, split 1:40, 280 °C  
 Carrier gas: 1.5 bar H<sub>2</sub>  
 Temperature: 80 °C → 280 °C (10 min), 8 °C/min  
 Detector: FID 280 °C

#### Peaks:

1. n-Decane
2. 1-Octanol
3. n-Undecane
4. 2,6-Dimethylphenol
5. 2,6-Dimethylaniline
6. Methyl decanoate
7. Methyl undecanoate
8. Dicyclohexylamine
9. Methyl dodecanoate

MN Appl. No. 211250

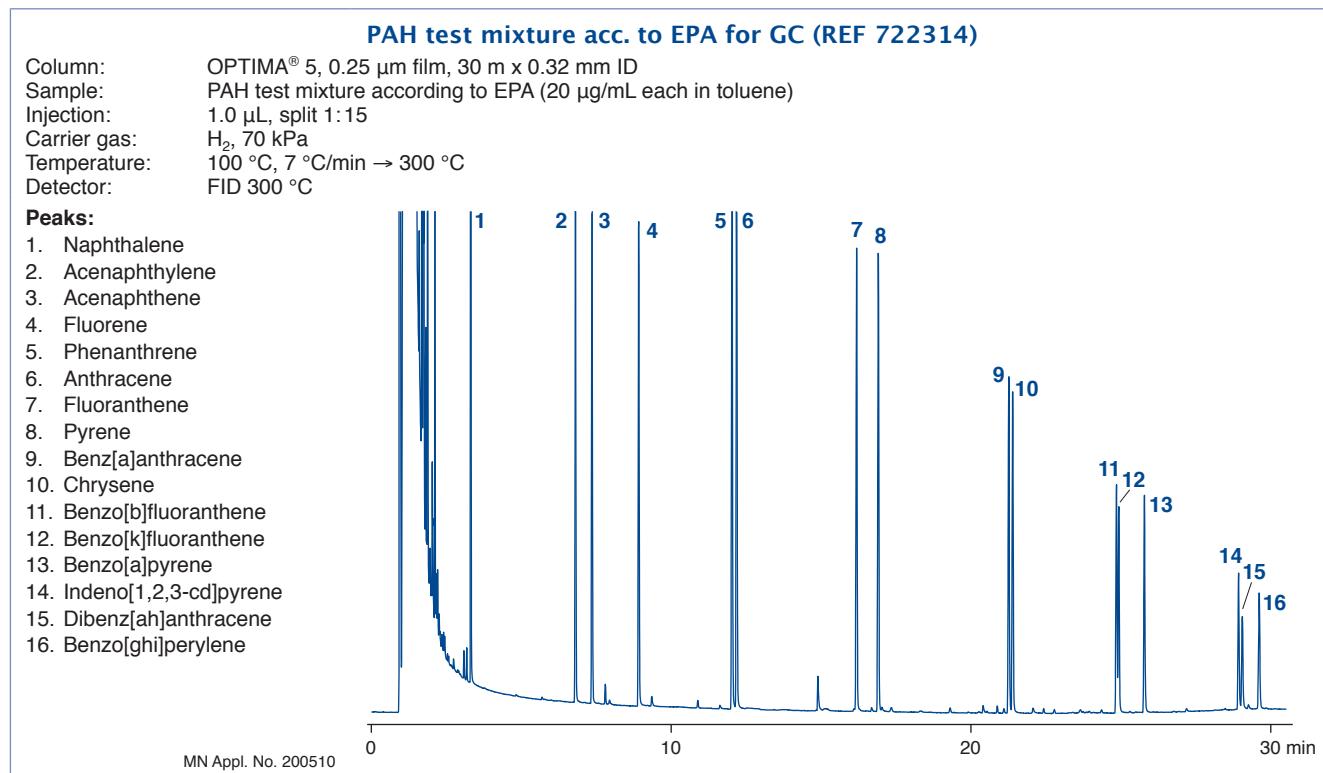

# Test mixtures for environmental analyses

## Ordering information

Designation	Composition	Pack of	REF
Haloform test mixture in <i>n</i> -pentane (qualitative)	9 halogenated hydrocarbons acc. to German drinking water specifications (in ng/mL): dichloromethane (795), chloroform (75), 1,1,1-trichloroethane (67), carbon tetrachloride (80), trichloroethylene (73), bromodichloromethane (100), dibromochloromethane (122), tetrachloroethylene (81), bromoform (145)	1 mL	722311
Haloform test mixture in methanol for head-space analyses (qualitative)	9 halogenated hydrocarbons in increased concentration for calibration acc. to German Industrial Standard DIN 38407, part 5 (in µg/mL): dichloromethane (158.4), chloroform (14.9), 1,1,1-trichloroethane (13.4), carbon tetrachloride (15.9), trichloroethylene (14.6), bromodichloromethane (20), dibromochloromethane (24.5), tetrachloroethylene (16.2), bromoform (28.9)	1 mL	722371
Haloform test kit (qualitative)	1 mL each of 9 single undiluted halogenated hydrocarbons and 1 mL each of test mixtures REF 722311 and REF 722371	11 x 1 mL	722312
PAH test mixture acc. to EPA in toluene	20 µg/mL each of naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benz[a]anthracene, chrysene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno[1,2,3-cd]pyrene, dibenz[a,h]anthracene, benzo[ghi]perylene	1 mL	722314
PAH test mixture acc. to German drinking water specifications in toluene	20 µg/mL each of fluoranthene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno[1,2,3-cd]pyrene, benzo[ghi]perylene	1 mL	722331
BTX test mixture in methanol	10 ng/µL each of benzene, ethylbenzene, toluene, <i>m</i> -, <i>o</i> -, <i>p</i> -xylene	1 mL	722372

These products contain harmful substances which must be specially labeled as hazardous. For detailed information please see MSDS.

## Reagents for GC

### PAH test mixture acc. to German drinking water specifications (REF 722331)

Column: OPTIMA® 5, 0.25 µm film, 25 m x 0.32 mm ID  
 Injection: 2 µL, split 1:10  
 Carrier gas: 0.6 bar H<sub>2</sub>  
 Temperature: 80 °C ↑ 180 °C → 300 °C, 4 °C/min  
 Detector: FID 300 °C

**Peaks:**

1. Fluoranthene
2. Benzo[b]fluoranthene
3. Benzo[k]fluoranthene
4. Benzo[a]pyrene
5. Indeno[1,2,3-cd]pyrene
6. Benzo[ghi]perylene

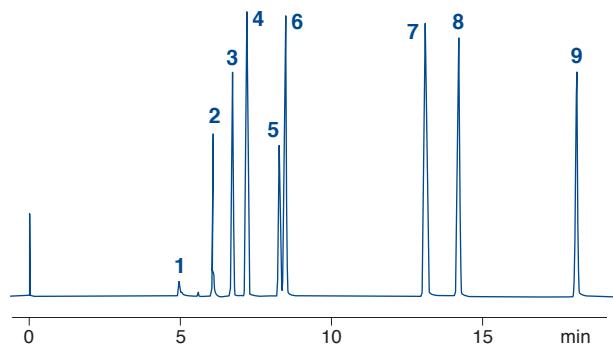

MN Appl. No. 200450

### Haloform test mixture (REF 722311)

Column: FS-SE-54, 0.35 µm film, 50 m x 0.25 mm ID  
 Injection: 1 µL, split ~ 1:30  
 Carrier gas: 1 bar N<sub>2</sub>  
 Temperature: 45 °C (10 min) → 120 °C, 8 °C/min  
 Detector: ECD 260 °C

**Peaks:**

1. Dichloromethane
2. Trichloromethane
3. 1,1,1-Trichlorethane
4. Tetrachloromethane
5. Trichloroethene
6. Bromodichloromethane
7. Dibromochloromethane
8. Tetrachloroethene
9. Tribromomethane

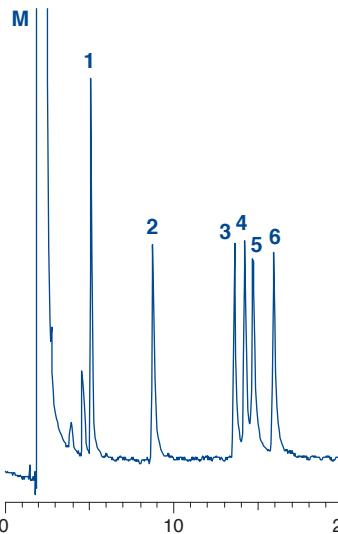

MN Appl. No. 211190

### BTX test mixture (REF 722372)

Column: HYDRODEX β-PM, 50 m x 0.25 mm ID  
 Injection: 2 µL (10 ng/µL each in methanol), split 40 mL/min  
 Carrier gas: 120 kPa H<sub>2</sub> (2.45 mL/min)  
 Temperature: 60 °C → 100 °C, 2 °C/min  
 Detector: FID 250 °C

**Peaks:**

- M = methanol
1. Benzene
  2. Toluene
  3. *p*-Xylene
  4. *m*-Xylene
  5. Ethylbenzene
  6. *o*-Xylene

MN Appl. No. 211220

# Accessories for capillary columns

## Ferrules for GC

- Graphite ferrules provide the highest temperature stability (up to 450 °C). They are reusable, if handled with care. We also offer 1/16" graphite ferrules specially designed for Carlo Erba / Fisons or for Agilent gas chromatographs.
- Vespel ferrules come in three types: pure Vespel, Vespel with 15% graphite and Vespel with 40% graphite. All versions are temperature-stable up to 400 °C and reusable.
- PTFE ferrules can only be used up to 250 °C. They are not reusable and not recommended for temperature programming. However, they show the best chemical inertness of all ferrules.

## Ordering information (packing unit 10 ferrules)

## Accessories for GC

### Valco fused silica adapters and fittings for capillary GC

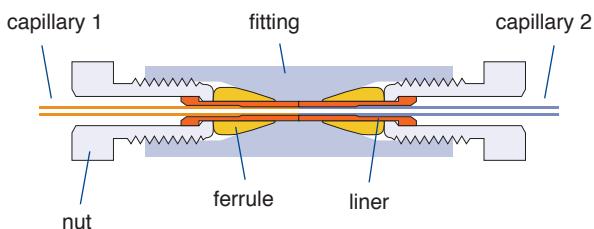

- ◆ **One-piece FS adapters:** recommended for use in fittings where the polyimide ferrule need not be removed
- ◆ **Two-piece removable FSR adapters:** recommended for use in Valco valves; consists of a liner which slides over the fused silica tubing, and a ferrule, both made of high temperature polyimide alloys  
The liner has an enlarged diameter at one end that is captured by the nut, so both (liner and tube) are removed when the nut is unscrewed from the valve (see figure below).  
The 1/16" FSR adapter comes with a special counterbored 1/16" nut (ZCN1) to receive the liner. The 1/32" adapter works with standard Valco 1/32" nuts.

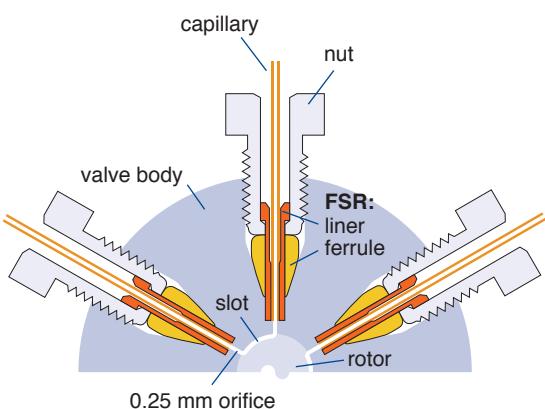

#### Union with FS adapters

#### Union with FSR adapters

#### Valve with FSR adapters

If you intend to use fused silica adapters (FS or FSR) with Valco unions, please order the fittings with "J" at the end of the Valco code and the appropriate number of adapters. The fittings in the table on the opposite page are supplied without stainless steel ferrules, but with standard nuts. For two-piece FSR adapters, the use of specially counterbored nuts ZCN1 (provided with the adapters) is mandatory.

#### Examples:

- 1) Connection of 2 capillaries with 0.25 mm ID and 0.4 mm OD: either use a 1/32" union ZU.5TJ and 2 FS adapters FS.4 or a 1/32" union ZU.5TJ and 2 removable FSR adapters FSR.4
- 2) Connection of 2 capillaries with 0.53 mm ID and 0.8 mm OD: we recommend either a 1/16" union ZU1TJ and 2 FS adapters FS1-.8 or a 1/16" union ZU1TJ and 2 removable FSR adapters FSR1.8

If capillaries 1 and 2 have different outer diameters, the corresponding different FS adapters have to be used.

If you want to use Valco valves with fused silica adapters, you need to order the required quantity of FSR adapters in addition to the valve. Please note that the specially counterbored nut ZCN1, included in FS1R.5 and FS1R.8, is still mandatory for 1/16" FSR adapters.

#### Examples:

- 1) Attachment of a capillary with 0.32 mm ID (0.5 mm OD) to a valve with 1/32" fittings: we recommend the removable FSR adapter FSR.5.
- 2) Attachment of a capillary with 0.53 mm ID (0.8 mm OD) to a valve with 1/16" fittings: we recommend the removable FSR adapter FSR1.8.

<b>Tools for Valco fused silica adapters</b>				
OEW	open end wrench (3/16" x 1/4")	1	724423	for use with 1/32" fittings
PV	pin vise and drill index (0.34 to 1.0 mm)	1	724424	application see text below

In case of a broken tubing in a through-bore union, remove the nut and the intact tubing on the opposite site of the broken one. Clear the fitting by pushing a fine wire or capillary drill through the center.

To remove ferrules from fittings, we recommend the use of a ferrule removal kit (Valco code FRK1). Use a pin vise and drill index (Valco code PV) to widen the inner diameters of FS adapters.

For other fittings and valves for GC please ask for our VICI® / Valco program.

## Accessories for GC

# Accessories for capillary columns

## Connectors for capillary GC columns

- Graphseal ferrules for capillary columns:** a stainless steel ferrule filled with graphite – the ideal sealing material for capillaries · The capillary is mounted on a 1/16" exit (detector, injector etc.), with the appropriate ferrule, a nut (with slit) and an adapter (see table below).
- Glass connectors** for fused silica capillary columns from 0.2 to 0.53 mm ID manufactured from deactivated glass with slightly tapered inner diameter; used to join two fused silica capillaries of equal or different diameters. Advantages compared to stainless steel fittings are easy connection without tools, optical control during connection, negligible heat capacity and no dead volume.
- PTFE shrink tube** also applicable for capillary connection. The minimum ID of the expanded tubing is 1.17 mm, the maximum ID of the shrunk tube is 0.40 mm. Shrinking occurs above 310 °C. Connections with PTFE shrink tube are applicable up to 200 °C only. They should never be used above 250 °C.

## Tools and general accessories for GC

### Diamond file:

a useful tool for cutting capillaries and smoothing ends of capillaries. Square capillary ends are especially important for butt connections (e.g., in Valco unions).

### Magnifying lens:

an essential tool for any laboratory.

In capillary GC it is often important to inspect column integrity or check cut ends of capillaries. When closing a column by melting the magnifying lens can be used to check whether the column is really closed or whether an open channel has been formed in the sealed end. Our lens provides 8fold magnification and is supplied with a scale as pictured in the figure below. The space between lines is equivalent to 1/10 mm.

### Glass wool, quartz wool and glass fiber wadding

are used for, e.g., GC liners, packed GC columns etc.

Lens with scale
